

Paying for Maintenance, Not Protection

Instant normalization, immediate threat hunting.

"We pay for SOC but most of their time is spent fixing logs."

"A breach slipped through because a critical log wasn't parsed right."

You shouldn't have to audit your security vendor's data pipeline to make sure you are protected. When a SOC spends more time troubleshooting broken log feeds than investigating malicious activity, you aren't paying for defense—you are paying for data maintenance. True operational integrity requires continuous, automated validation of your entire telemetry stream.

CYREBRO AI eliminates structural blind spots by ensuring your log ingestion pipeline is always healthy and reliable:

Key Benefits:

- **Automated Health Checks:** The platform continuously and proactively verifies the health, delivery speed, and overall structural completeness of all active log sources.
- **Smart Parsing Guardrails:** Instantly corrects mapping anomalies on the fly, ensuring that critical data points are never dropped or misread due to a formatting change.
- **Proactive Gap Prevention:** Automatically flags inactive or dropping telemetry streams, letting you remediate visibility gaps before adversaries can exploit them.
- **Guaranteed 100% Log Coverage:** Keeps your security data pipelines flawlessly aligned and active, giving you complete confidence in your monitoring infrastructure.
- **Eradication of Detection Gaps:** Prevents catastrophic breach oversights by ensuring critical high-severity alerts are always parsed accurately and escalated instantly.
- **Maximizing Cybersecurity ROI:** Reclaims your actual budget by shifting your security investment away from tedious data engineering and entirely onto proactive threat defense.

Protect, don't parse – get full coverage with CYREBRO AI.
